

poligon[®] | Equipment Enclosures

Poligon offers equipment enclosures to protect mechanical equipment while providing a safety barrier between patrons and machinery. Each structure is enclosed with perforated paneling that allows both ventilation and privacy. They are also a functional way to mask unsightly equipment from public view. Structures can be adjusted to any size and shape to meet your site needs.

Perforated panels are made from aluminum, and powder coated to match steel frame. Hole size can be adjusted to create various privacy levels and airflow, however, typical size is 1/4" diameter. Shelters can be designed with various types of entry points, including lockable double doors, removable wall pieces, or by leaving open sections without enclosure panels.

- > Concealment
- > Airflow

Enclosed structures are ideal for aquatic centers, amusement parks, and other locations where mechanical equipment is on-site. Structures can also be used for equipment storage or to disguise portable restrooms and trash areas. Each structure is designed and engineered for your site, sized specifically for your needs and space constraints.

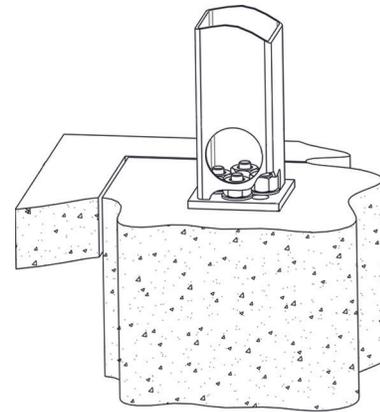

11' x 16' Hip Roof

11' x 16' Monoslope

- While each structure is uniquely designed for your site, we do have typical configurations and sizes that are frequently requested.
- Gates can be configured with either perforated aluminum or solid metal panels.
- Panels can be powder coated the same color as the frame or a different color for more contrast.
- Structure is secured to foundation with hidden bolts for a seamless look.

Please contact us to request a sample of perforated aluminum
